- 2) Write a code demonstrating the steps to establish a database connection using JDBC.
Write a java program to accept the details of Teacher (TId, Name, Address) from the user and insert it into the MySQL database, specifying the necessary connection parameters such as URL, username, and password.

```

Public class TeacherInsert {
    Public static void main (String[] args) {
        Scanner scanner = new Scanner (System.in);
        String url = "jdbc:mysql://localhost:3306/
        String username = "root";
        String password = "your-password";
        System.out.println ("Enter Teacher ID:");
        int tid = scanner.nextInt();
        scanner.nextLine();
        System.out.println ("Enter Teacher Name");
        String name = scanner.nextLine();
        System.out.println ("Enter Teacher
        Address:");
        String address = scanner.nextLine();
        String sql = "INSERT INTO teacher (TId,
        Name, Address) VALUES (?, ?, ?)";
        try {
            catch (SQLException e) {
                e.printStackTrace();
            } finally {
                scanner.close();
            }
        }
    }
}

```

In-Lab:

1) You are developing a student information management system. Implement a servlet called "StudentDetailsServlet" that accepts student details (student ID, student name, address, program) through a form submission. The servlet should store these details in a database using JDBC integration. CRUD operations on Student Database sequence of steps to follow:

- Create a Student Database using JDBC program
- Create a Registration Table Inside Student Database with the fields (i)id (ii)name(iii)address(iv)program and make id as a primary key) using JDBC Program
- Insert 4 records in Registration Table of Student Database using JDBC Program
- Display the records inserted in Registration Table using JDBC Program
- Update the age of student as 30 whose id values are as 100 and 101 using JDBC Program.
- Delete a Student Record whose id=101 from Registration Table using JDBC Program.

Procedure/Program:

```
import java.sql.*;

public class with main {
    String url = "jdbc:mysql://localhost:3306/";
    String username = "root";
    String password = "your-password";
    try {
        Connection Conn = DriverManager.getConnection(url, username, password);
        Statement Stmt1 = Conn.createStatement();
        Stmt1.executeUpdate("CREATE DATABASE IF NOT EXISTS studentDB");
        System.out.println("Student Database created successfully!");
    }
}
```

Experiment#		Student ID	
Date		Student Name	

Stmt execute update ("USE StudentsBB");

String createTableSQL = "CREATE TABLE IF NOT
EXISTS Registration (" + "id int primary
key " + "name varchar(100),
address VARCHAR(255),
"Program VARCHAR(100)";

Stmt.execute update (createTableSQL);
System.out.println ("Registration table
created successfully");

String updateSQL = "UPDATE Registration
SET program = 'updated program'
where id in (100, 101);

try (Statement stmt) 3 = conn. create
Statement (1);

Stmt 3 - execute update (updateSQL);

String deleteSQL = "DELETE FROM Registration
where id = 101";

catch (SQLException e) {
e.printStackTrace();
}

Date		Student Name	

✓ **Data and Results:**

The program successfully creates a database, inserts student records, displays them, updates data, and delete a record from database.

✓ **Analysis and Inferences:**

The JDBE operations effectively demonstrates CRUD functionality, showcasing how Servlets can manage databases records dynamically in a web application.

VIVA-VOCE Questions (In-Lab):

1) What is the role of JDBC in Java database connectivity?

JDBC enables java applications to connect to databases, execute SQL queries, and retrieve results for database interaction.

2) What are the different types of JDBC drivers? Explain their differences and advantages.

- ① JDBC → ODBC bridge
- ② Native-API
- ③ Network Protocol
- ④ Thin Driver

Type 4 is most commonly used as it is platform-independent and efficient

Date		Student Name	

3) How do you establish a database connection using JDBC?

Use DriverManager.getConnection() with Connection URL, Username, and password to establish a connection to database.

4) Explain the difference between Statement and PreparedStatement in JDBC.

Statement is used for simple queries, while PreparedStatement is precompiled, more secure, and efficient.

5) How do you handle exceptions related to database operations in JDBC? What are some common JDBC-related exceptions?

Use try-catch blocks to catch SQLException & handles database errors. Common exceptions include SQL Syntax Error Exception, SQL Timeout Exception, and SQL Integrity Constraint Violation Exception.

Post-Lab:

- 1) Write a JDBC program to Connect to a Database in PostgreSQLServer. Hint: Create a "test" database in PostgreSQL server and check whether it is connected or not through JDBC Program (Display a message "Connected to the database" if username and password matched, otherwise display a message "Invalid username or password".)

Procedure/Program:

```

import java.sql.*;

Public class Postgress JDBC {
    Public static void main (String[] args) {
        String url; "jdbc:postgresql://localhost:5432/test";
        String user = "your-name";
        String password = "your-password";
        try {
            Connection conn = DriverManager
                .getConnection(url, user, password);
            System.out.println ("Connected to database");
        } catch (SQLException e) {
            System.out.println ("Invalid username
                (or password)");
        }
    }
}

```

Experiment#			
Date		Student ID	
		Student Name	

✓ **Data and Results:**

The program successfully connects to the PostgreSQL 'test' database, displaying a success or error based on credentials

✓ **Analysis and Inferences:**

The JDBC connection handles authentication, ensuring that valid credentials are required for database access and providing appropriate feedback.
