

Experiment #7		Student ID	
Date		Student Name	[@KLWKS_BOT THANOS]

Experiment Title: Implementation of Programs on Greedy method-II.

Aim/Objective: To understand the concept and implementation of Basic programs on Greedy method.

Description: The students will understand and able to implement programs on Greedy method.

Pre-Requisites:

Knowledge: Greedy Method and its related problems in C/Java/Python

Tools: Code Blocks/Eclipse IDE

Pre-Lab:

You are given a knapsack with a fixed capacity and a set of items, each with a weight and a value. Find the maximum value you can obtain by taking fractions of items in a greedy manner (maximize the value-to-weight ratio).

Input: A list of items with their values and weights, and the capacity of the knapsack.

Output: The maximum value that can be obtained.

Example:

Input:

Items = [(60, 10), (100, 20), (120, 30)], Capacity = 50

Output: 240.0

- **Procedure/Program:**

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
typedef struct {
```

```
    int value;
```

```
    int weight;
```

```
    float ratio;
```

```
} Item;
```

Course Title	Design and Analysis of Algorithms	ACADEMIC YEAR: 2024-25
Course Code(s)	23CS2205A & 23CS2205E	1 Page

Experiment #7		Student ID	
Date		Student Name	[@KLWKS_BOT THANOS]

```
int compare(const void* a, const void* b) {
```

```
    float r1 = ((Item*)a)->ratio;
```

```
    float r2 = ((Item*)b)->ratio;
```

```
    return (r2 > r1) - (r1 > r2);
```

```
}
```

```
float fractionalKnapsack(Item items[], int n, int capacity) {
```

```
    for (int i = 0; i < n; i++) {
```

```
        items[i].ratio = (float) items[i].value / items[i].weight;
```

```
    }
```

```
    qsort(items, n, sizeof(Item), compare);
```

```
    float totalValue = 0;
```

```
    int remainingCapacity = capacity;
```

```
    for (int i = 0; i < n; i++) {
```

```
        if (remainingCapacity == 0) {
```

```
            break;
```

```
        }
```

```
        if (items[i].weight <= remainingCapacity) {
```

```
            totalValue += items[i].value;
```

```
            remainingCapacity -= items[i].weight;
```

```
        } else {
```

```
            totalValue += items[i].value * ((float)remainingCapacity / items[i].weight);
```

Course Code(s)	23CS2205A & 23CS2205E	2 Page

Experiment #7		Student ID	
Date		Student Name	[@KLWKS_BOT THANOS]

```
remainingCapacity = 0;
```

```
}
```

```
}
```

```
return totalValue;
```

```
}
```

```
int main() {
```

```
    Item items[] = {{60, 10}, {100, 20}, {120, 30}};
```

```
    int capacity = 50;
```

```
    int n = sizeof(items) / sizeof(items[0]);
```

```
    printf("Maximum value that can be obtained: %.2f\n", fractionalKnapsack(items, n, capacity));
```

```
    return 0;
```

```
}
```

- Data and Results:**

Data:

Items: [(60, 10), (100, 20), (120, 30)], Capacity: 50.

Result:

Maximum value that can be obtained: 240.00.

- **Inference Analysis:**

Analysis:

Greedy approach maximizes value by prioritizing value-to-weight ratio.

Inferences:

Higher value-to-weight ratio leads to optimal selection of items.

In-Lab:

Given a set of characters with their frequencies, use the Huffman coding algorithm to generate the optimal binary prefix codes.

Input: A set of characters and their corresponding frequencies.

Output: The Huffman codes for each character.

Example:

Input:

char[] characters = {'F', 'G', 'H', 'T', 'J'};

int[] frequencies = {2, 7, 24, 14, 10};

Huffman Codes:

F: 000

G: 001

J: 01

I: 10

H: 11

Output: Huffman codes for the characters.

'F' → 000

'G' → 001

'J' → 01

'T' → 10

'H' → 11

```

    printf("%c' → %s\n", root->character, code);
}
}
int main() {
    char characters[] = {'F', 'G', 'H', 'I', 'J'};
    int frequencies[] = {2, 7, 24, 14, 10};
    int size = sizeof(characters) / sizeof(characters[0]);

    struct Node* root = buildHuffmanTree(characters, frequencies, size);

    char code[100];
    printHuffmanCodes(root, code, 0);

    return 0;
}

```

- **Data and Results:**

Data:

Input characters: {'F', 'G', 'H', 'I', 'J'}, frequencies: {2, 7, 24, 14, 10}.

Result:

Huffman codes: 'F' → 000, 'G' → 001, 'J' → 01, 'I' → 10, 'H' → 11.

- **Analysis and Inferences:**

Analysis:

Huffman algorithm optimally assigns shorter codes to higher frequencies.

Inferences:

Efficient compression achieved by assigning codes based on frequencies.

Post-Lab:

There are n people whose IDs go from 0 to n - 1 and each person belongs exactly to one group. Given the array group_Sizes of length n telling the group size each person belongs to, return the groups there are and the people's IDs each group includes. You can return any solution in any order and the same applies for IDs. Also, it is guaranteed that there exists at least one solution.

Example 1:

Input: group_Sizes = [3, 3, 3, 3, 3, 1, 3]

Output: [[5], [0, 1, 2], [3, 4, 6]]

Explanation: Other possible solutions are [[2, 1, 6], [5], [0, 4, 3]] and [[5], [0, 6, 2], [4, 3, 1]].

Example 2:

Input: group_Sizes = [2, 1, 3, 3, 3, 2]

Output: [[1], [0, 5], [2, 3, 4]]

- **Procedure/Program:**

```
#include <stdio.h>
```

```
#include <stdlib.h>
```

```
void groupThePeople(int* group_Sizes, int n) {
    int **result = (int**)malloc(n * sizeof(int*));
    int *groupCount = (int*)calloc(n, sizeof(int));
```

```
    for (int i = 0; i < n; i++) {
        int size = group_Sizes[i];
        if (groupCount[size] == 0) {
            result[size] = (int*)malloc(size * sizeof(int));
        }
        result[size][groupCount[size]] = i;
        groupCount[size]++;
    }
```

```
    for (int i = 0; i < n; i++) {
        if (groupCount[i] > 0) {
            printf("[");
            for (int j = 0; j < groupCount[i]; j++) {
                printf("%d ", result[i][j]);
            }
        }
    }
```

Course Title	Design and Analysis of Algorithms	ACADEMIC YEAR: 2024-25
Course Code(s)	23CS2205A & 23CS2205E	9 Page

Experiment #7		Student ID	
Date		Student Name	[@KLWKS_BOT THANOS]

```

    }
    printf("]\n");
}
}

free(result);
free(groupCount);
}

int main() {
    int n;
    scanf("%d", &n);

    int* group_Sizes = (int*)malloc(n * sizeof(int));

    for (int i = 0; i < n; i++) {
        scanf("%d", &group_Sizes[i]);
    }

    groupThePeople(group_Sizes, n);

    free(group_Sizes);

    return 0;
}

```

- **Data and Results:**

Data: Input contains group sizes for people, ranging from 0 to n-1.

Result: Groups are printed based on their respective group sizes.

Course Title	Design and Analysis of Algorithms	ACADEMIC YEAR: 2024-25
Course Code(s)	23CS2205A & 23CS2205E	10 Page

Experiment #7		Student ID	
Date		Student Name	[@KLWKS_BOT THANOS]

- **Analysis and Inferences:**

Analysis: Time complexity is $O(n)$, efficient for grouping people with sizes.

Inferences: Solution works well with varying group sizes for multiple people.

- **Sample VIVA-VOCE Questions:**

1. How does a Greedy algorithm make decisions at each step?

Greedy Algorithm Decisions: It makes locally optimal choices at each step, hoping to find a global optimum.

2. Does the greedy approach consider future data and choices?

Greedy Approach and Future Choices: No, it makes decisions based only on current data, not future possibilities.

3. Applications of Greedy Method?

Applications of Greedy Method:

- Kruskal's and Prim's algorithms (minimum spanning tree)
- Huffman coding (data compression)
- Activity selection problem
- Fractional knapsack problem

Course Title	Design and Analysis of Algorithms	ACADEMIC YEAR: 2024-25
Course Code(s)	23CS2205A & 23CS2205E	11 Page

Experiment #7		Student ID	
Date		Student Name	[@KLWKS_BOT THANOS]

4. Difference between Divide & Conquer algorithm & Greedy algorithm?

Difference Between Divide & Conquer and Greedy Algorithms:

- **Divide & Conquer:** Breaks a problem into subproblems, solves them recursively, and combines solutions.
- **Greedy:** Makes a sequence of choices based on immediate benefits, not considering future steps.
