TUTORIAL SESSION 20:

Variants of TM: Multi-Tape and NDTM

Concept Building

Multi-Tape Turing Machine (MTM)

A Multi-Tape Turing Machine (MTM) is an extension of the classical single-tape Turing machine. It consists of multiple tapes, each with its own head for reading and writing. Here are some key features:

Multiple Tapes: Instead of one tape, an MTM has several tapes, typically k tapes where k is a positive integer.

Independent Heads: Each tape has its own head that can move independently of the others, either left, right, or stay in place.

Transition Function: The transition function is more complex and takes into account the symbols under all k heads and dictates the new states, symbols to write, and movements of all heads.

Enhanced Computational Power: While MTMs do not provide more computational power in terms of solvable problems (they are equivalent to single-tape Turing machines in this respect), they can be more efficient, potentially solving problems faster by simulating certain computations more effectively.

Non-Deterministic Turing Machine (NDTM)

A Non-Deterministic Turing Machine (NDTM) is a theoretical model of computation that extends the classical deterministic Turing machine with the ability to explore multiple computation paths simultaneously. Here are the key features:

5. **Non-Deterministic Transitions:** At any given state and tape configuration, an NDTM can have multiple possible transitions.
6. **Parallel Computation Paths:** The machine can be thought of as exploring all possible transitions in parallel. If any computation path leads to an accepting state, the NDTM accepts the input.
7. **Acceptance Criteria:** An input is accepted if there exists at least one sequence of transitions leading to an accepting state.
8. **Theoretical Power:** NDTMs are used primarily in theoretical computer science to study problems in the complexity class NP (nondeterministic polynomial time). They are not realizable as physical machines but provide a useful abstraction for understanding computational complexity.

Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

Pre-Tutorial (To be completed by student before attending tutorial session)

1. Differentiate deterministic and non-deterministic Turing Machine.

Solution:.

Deterministic Turing Machine (DTM):

- Has a unique transition for each state and input.
- Only one computation path is followed.
- Simpler, with predictable behavior.

Non-Deterministic Turing Machine (NDTM):

- Can have multiple transitions for a state and input.
- Multiple computation paths can be explored simultaneously.
- Useful in theoretical models for complex problems.

Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

2. Can a non-deterministic Turing machine be used to solve Halting Problem? Explain.

Solution:

No, an NDTM cannot solve the Halting Problem.

Reasons:

- The Halting Problem is undecidable.
- Non-determinism doesn't solve undecidability.
- No machine can decide halting for all inputs.

Course Title	AUTOMATA THEORY AND FORMAL LANGUAGES	ACADEMIC YEAR: 2023-24 220
Course Code(s)	22CS2002A	Page 220 of 261

Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

3. Write the transition function for a k-tape Turing machine.

Solution:

$$\delta(q, s_1, s_2, \dots, s_k) = (q', r_1, r_2, \dots, r_k, d_1, d_2, \dots, d_k)$$

where:

- **q**: current state.
- **s₁, s₂, ..., s_k**: symbols read on k tapes.
- **q'**: new state.
- **r₁, r₂, ..., r_k**: symbols to write.
- **d₁, d₂, ..., d_k**: move directions (L, R, S).

IN-TUTORIAL (To be carried out in presence of faculty in classroom)

1. What is the primary advantage of a multi-tape Turing machine over a single-tape Turing machine?

Solution:

- **Efficiency**: Simultaneous read/write on multiple tapes.
- **Reduced scanning**: Avoids repetitive tape movements.
- **Faster computation**: Complex tasks are completed more quickly.

Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

2. Explain how multiplication of two integers can be done using multi-tape Turing Machine.

Solution:

- 1. Tape 1: First integer.**
- 2. Tape 2: Second integer.**
- 3. Tape 3: Result (initialized to 0).**
- 4. Process:** Multiply bit by bit, shifting and adding partial sums efficiently using multiple tapes.

Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

3. What is an example of a problem that is easier to solve with an NDTM?

Solution:

An example is the **context-free language (CFL) recognition** problem.

- **NDTM:** Can guess the correct derivation path and check efficiently.
- **DTM:** Must exhaustively explore all possibilities, which is slower.

Post-Tutorial (To be carried out by student after attending tutorial session)

1. How is the time complexity of an NDTM measured?

Solution:

Time complexity of an NDTM is measured by the longest path it explores, assuming all paths are checked in parallel.

2. Can the behavior of an NDTM be simulated by a DTM? Explain with an example.

Solution:

Yes, an NDTM can be simulated by a DTM.

Example: For 3-SAT:

- **NDTM:** Simultaneously tests all variable assignments.
- **DTM:** Checks each assignment one by one, leading to exponential time.

Date	<TO BE FILLED BY STUDENT>	Student Name	<TO BE FILLED BY STUDENT>

3. What is the relationship between the time complexity of a non-deterministic Turing machine and a deterministic Turing machine?

Solution:

- **NDTM:** Can solve certain problems in **polynomial time**.
- **DTM:** May take **exponential time** to solve the same problems.
- **Relationship:** Time complexity of **NDTM** is generally **better** (polynomial vs. exponential) than **DTM** for NP problems.

Viva – Questions

1. Explain the concept of a multi-tape Turing machine and its advantages over a single-tape Turing machine.

Solution:

A multi-tape Turing machine has multiple tapes for simultaneous read/write.

Advantages:

- **Faster computation.**
- **Increased efficiency for complex tasks.**

2. Can a Turing machine with a finite number of states recognize all recursively enumerable languages? Explain.

Solution:

No, a finite-state Turing machine can't recognize all recursively enumerable languages due to limited memory.
